21LEM202T — Unit 2, Session 6, SLO 1

Part A — Key Ideas (Recap)

• The Body is an orderly system (a harmony) with definite conduct — cells work together in harmony, forming tissues, organs and organ systems. With a feeling of self-regulation, the Self ensures the continuity of harmony in the body (at least it does not disturb it). Health is the natural outcome of self-regulation.

• Program for health, in priority order: (1) Intake (food, water, air, sunlight…) and Routine/lifestyle; (2) Labour and Exercise; (3) Postures for regulating internal & external body organs (e.g. yoga) and Regulated breathing (e.g. pranayam); (4) Medicine and Treatment. This is a program for health, not the only program for health.

• Purposes:

• Intake should be nutritious, digestible, tasty and such that the waste is excretable; water in the right amount and time; daily fresh air and sunlight. The circadian rhythm, the rhythm of seasons and the body's lifecycle rhythm help set up a harmonious routine.

• Labour produces physical facility (e.g. sweeping, kitchen gardening, cycling to college); exercise does not produce physical facility (e.g. jogging, gym work). Medicine (home remedies / integrated systems) brings the body back to harmony; treatment uses a drug/machine to perform a body function (dependence).

a) for staying healthy;

b) for bringing the body back to harmony from temporary disharmony;

c) dependence on a drug/machine to perform a body function.

The Body is an orderly system (a harmony) with definite conduct — cells work together in harmony, forming tissues, organs and organ systems. With a feeling of self-regulation, the Self ensures the continuity of harmony in the body (at least it does not disturb it). Health is the natural outcome of self-regulation.

This is a program for health, not the only program for health.

Purposes: (A) for staying healthy; (B) for bringing the body back to harmony from temporary disharmony; (C) dependence on a drug/machine to perform a body function.

Intake should be nutritious, digestible, tasty and such that the waste is excretable; water in the right amount and time; daily fresh air and sunlight. The circadian rhythm, the rhythm of seasons and the body's lifecycle rhythm help set up a harmonious routine.

Labour produces physical facility (e.g. sweeping, kitchen gardening, cycling to college); exercise does not produce physical facility (e.g. jogging, gym work). Medicine (home remedies / integrated systems) brings the body back to harmony; treatment uses a drug/machine to perform a body function (dependence).

Part B — In-Class Activity

Activity 1 — Match the program level to its purpose

For each level of the program, write its purpose: A (staying healthy), B (back to harmony from temporary disharmony) or C (dependence).

Program level	Purpose (A / B / C)
Intake & Routine (lifestyle)	**A**
Labour & Exercise	**A**
Postures & Regulated Breathing	**A**
Medicine (home remedies / integrated systems)	**B**

Program level	Purpose (A / B / C)
Treatment (drug / machine performing a body function)	**C**

Activity 2 — Labour or Exercise?

Mark each activity as Labour (produces physical facility) or Exercise (produces none).

Activity	Labour / Exercise
Sweeping and swabbing your room / house	**Labour**
Kitchen gardening	**Labour**
Cycling to college and back	**Labour**
Jogging outdoors	**Exercise**
Weight training in a gym	**Exercise**
Exercise cycling in a gym	**Exercise**

Activity 3 — A self-regulated daily schedule

Approximately how much time would you allocate each day for keeping the body in good health through:

- Healthy intake (food, air, water, sunlight): _____
- Upkeep of the body (sleep/wake, excretion, bathing): _____
- Labour (production of physical facility): _____
- Balancing internal & external organs (postures): _____
- Regulated breathing: _____
- Do you think this schedule makes you more or less productive? What do you conclude?
- Healthy intake (food, air, water, sunlight): **2 hours**
- Upkeep of the body (sleep/wake, excretion, bathing): **8 hours**
- Labour (production of physical facility): **2 hours**
- Balancing internal & external organs (postures): **30 minutes**
- Regulated breathing: **15 minutes**
- This schedule makes me **more productive** because a healthy body supports focused and efficient work. I conclude that self-regulation in daily routine leads to sustained energy and better time management.

Part C — Long-Answer Questions

Q1. Why is health described as a "natural outcome" of the feeling of self-regulation? Explain self-regulation and health. [5]

Self-regulation is the conscious and harmonious management of one's thoughts, feelings, and actions based on natural acceptance, without external force. Health is the state of the body being in harmony with itself and with the self, characterized by proper functioning of all organs and systems. Health is a natural outcome of self-regulation because when we regulate our intake, activity, rest, and emotions according to our natural acceptance, the body automatically maintains its harmony and does not fall into disease. Thus, health is not something to be forced but arises naturally from a self-regulated lifestyle.

Q2. State the program for health in priority order, and explain each level briefly. [5]

1. **Intake & Routine (lifestyle)** — Proper food, air, water, sunlight, sleep, and daily habits to maintain basic health.
2. **Labour & Exercise** — Physical activity that either produces facility (labour) or maintains fitness (exercise).
3. **Postures & Regulated Breathing** — Yogic postures (asanas) and breathing techniques (pranayama) to balance internal and external organs.
4. **Medicine (home remedies / integrated systems)** — Natural or traditional remedies to correct temporary disharmony.
5. **Treatment (drug / machine performing a body function)** — Medical intervention when the body cannot restore harmony on its own; this indicates dependence.

Q3. Distinguish labour from exercise, giving examples of each. [5]

Labour is physical activity that produces a tangible physical facility or product, such as sweeping, gardening, or cycling to work. Exercise is physical activity done solely for fitness or health, producing no physical facility, such as jogging, weight training, or stationary cycling. Labour serves both health and utility, while exercise only serves health.

Q4. How is self-regulation different from self-control or self-restraint? [5]

Self-regulation is a positive, conscious, and natural alignment of one's actions with one's natural acceptance, leading to harmony and fulfillment. Self-control or self-restraint often implies suppressing desires or forcing oneself to follow rules, which can create inner conflict. Self-regulation is based on understanding and choice, while self-control is based on willpower and resistance. Self-regulation leads to lasting harmony, whereas self-control may be temporary and stressful.

Q5. Recall the times in the last three years your body has been ill; what steps restored harmony? Design a daily schedule with a strong feeling of self-regulation, and state whether you think it makes you more or less productive. [5]

In the last three years, I had a common cold and a mild fever. I restored harmony by taking rest, drinking warm water, eating light food, and practicing deep breathing. My daily schedule with self-regulation: wake at 6 AM, 15 min breathing, 30 min yoga, healthy breakfast, 2 hours of labour (cleaning/gardening), study/work with breaks, balanced lunch, short walk, evening study, dinner by 7 PM, sleep by 10 PM. This schedule makes me **more productive** because a healthy body and calm mind allow me to focus better and complete tasks efficiently.

Self-Reflection (Take-Home)

• For your food: is it nutritious? Is the waste excretable? Are you trying to fetch happiness from the taste? (Slide 31)

• For your clothes: are they appropriate for the season? Are you trying to get respect from others on the basis of clothes? (Slide 32)

• For my food: I try to eat nutritious, easily digestible food and avoid eating for taste alone. I realize that happiness comes from within, not from taste.

• For my clothes: I wear clothes suitable for the season and do not seek respect from others based on clothing. I understand that respect comes from my behavior and character.
